

Workload Assessment

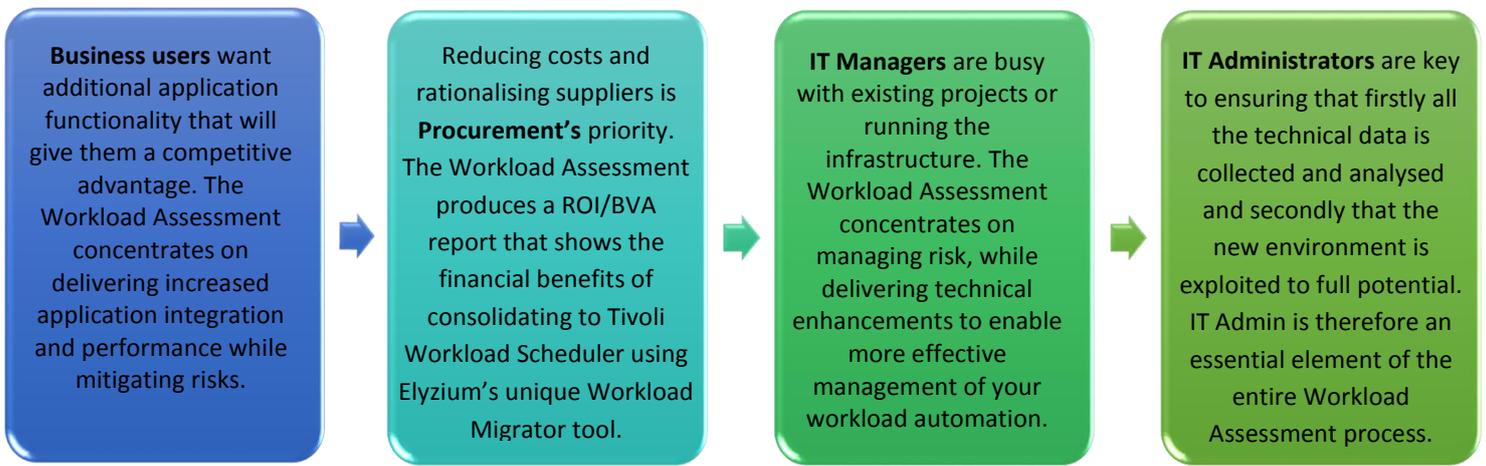

AT A GLANCE

Elyzium's Workload Assessment provides organisations with a complete appraisal of their workload automation environment, providing the justification required to move towards a consolidated environment, whilst setting out a clear path to allow you to achieve your goals with no impact to your business.

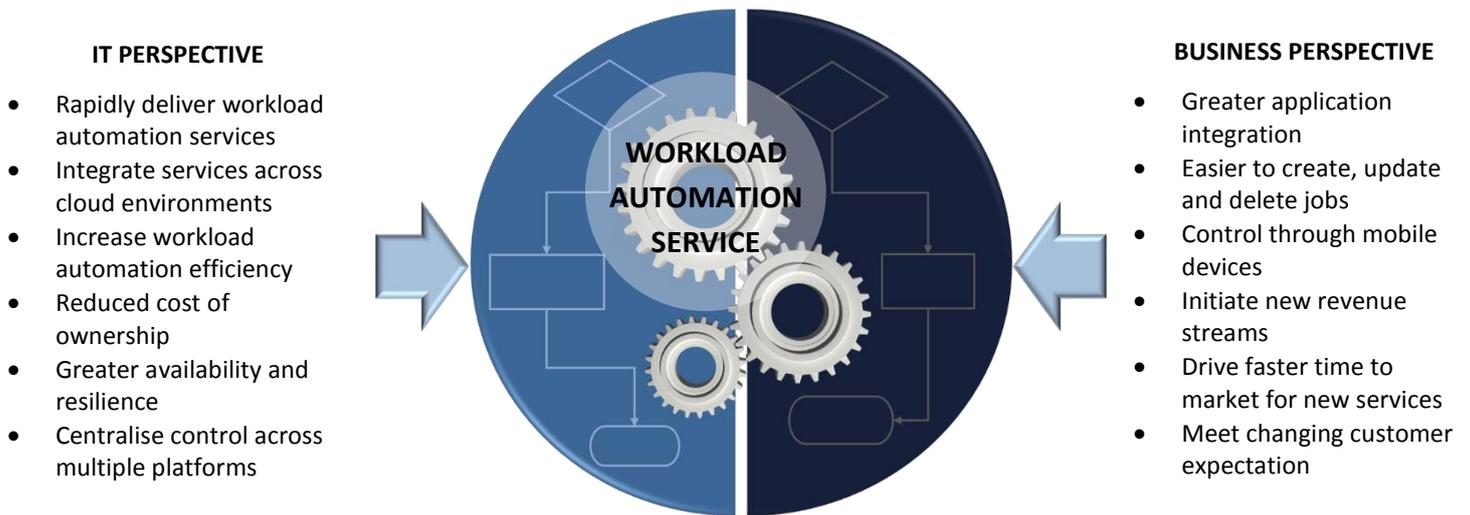

Historically, Workload Automation has grown organically, with inefficiencies often side-lined by IT in favour of other priorities. But, pressure on the Workload Automation Service - from both IT and Business perspectives - is growing continually, and lines of business must now support dynamic, and often on-demand, environments, across both physical and virtual systems. Failures within Workload Automation environments can result in substantial loss of revenue and significant brand damage, hence priorities must change. But where should you start?

Whilst most operating systems, mission-critical applications and database management systems provide basic job scheduling capabilities, these point solutions are often conceived only to serve immediate needs of a given and closed solution. In a world of application diversity and connectivity, business processes will, by necessity, cross boundaries. As data flow increases, processing volumes grow and the infrastructure becomes more complex, IT increasingly relies on workload automation to automate and standardise file/data transfers, workflows, applications and processes and tie together the various landscapes of heterogeneous IT environments.

Elyzium's Workload Assessment allows organisations to review their current environment against a set of business needs to produce a strategic report, which forms the justification for change. The assessment provides a complete appraisal of both the business and IT requirements, gathering information from key stakeholders within the business to deliver the benefits they need:

The assessment allows you to mitigate risk with a process oriented, established conversion service that provides a complete Healthcheck of your current workload automation environment. Our experienced team begins by analysing the installed environment, and defining the desired environment along with a roadmap of steps required to get there. Details of jobs, schedules, resources and all other relevant specifics are collected and analysed. It is the analysis of this data, coupled with identification of any challenges in your environment, which uniquely enables Elyzium to deliver a fixed price engagement, with defined start and end dates, and most importantly no hidden costs.

Pressures on the Workload Automation Service grow continually. Elyzium's Workload Assessment considers and provides recommendations for all these pressures, whether IT or Business related

FEATURES AND BENEFITS

- ✓ **Fixed price, fixed time engagement with no hidden charges**
- ✓ **Delivered by the most experienced and accredited consultants in the field**
- ✓ **Fully considers both the business and IT processes and requirements**
- ✓ **Involves all key stakeholders throughout the process**
